

MRI: Rectal Scan

How to prepare and what to expect

This handout explains how an MRI scan of the rectum works, how it is done, how to prepare for it, what to expect, and how to get your results.

What is MRI?

Magnetic resonance imaging (MRI) is a way to take pictures of your internal organs and tissues. It uses radio waves and a strong magnet to provide clear and detailed pictures. Even different types of tissue within the same organ are easily seen in an MRI image. This scan will help your healthcare provider decide which treatment is best for your health condition.

What is a rectal MRI?

A *rectal* MRI takes pictures of your lower belly. The pictures will show your entire pelvic area and details of your *rectum*. The rectum is the last section of the large intestine, ending at the anus.

Most times, an MRI scan of this area involves taking 8 or 9 sets of pictures. Each set lasts 14 seconds to several minutes.

For Your Safety

Health Review

We need to know about certain **health conditions** before your scan. Please tell us if you:

- Have any problems with your liver or kidneys, or need a liver or kidney transplant
- Are on dialysis
- Have had any surgeries
- Have allergies to any drugs or *contrast* (X-ray dye)

Screening for Metal

If you have any metal on or in your body, an MRI can harm you. The strong MRI magnet will pull on any *ferromagnetic* object, such as iron and some other metals.

An MRI image of the pelvic area.

This is why we need to know if you have any metal in or on your body before we give you an MRI scan. Even small amounts of metal that will not harm your body can make the MRI picture unusable.

Please tell our staff if you have:

- Aneurysm clips, a heart pacemaker (or artificial heart valve), an implanted port, an infusion catheter (such as Port-o-cath, Infusaport, or Lifeport), an intrauterine device (IUD), any metal plates, clips, pins, screws, or surgical staples, a prosthetic hip, or any implanted metal object in your body
 - Most times, surgical staples, clips, plates, pins, and screws are not a risk during MRI if they have been in place for more than 4 to 6 weeks. If needed, we may do an X-ray to check for metal.
- Tattoos or permanent eyeliner
- Medicine patches
- A bullet or shrapnel in your body
- Ever worked with metal

How do I prepare?

- Please talk with your referring provider if you have any concerns about managing pain or anxiety during your MRI scan.
- *Women:* Tell your provider if you are pregnant or breastfeeding, or if there is any chance you could be pregnant.
- If you take iron medicines or supplements, you must stop taking them 48 hours before your scan. Please talk with the provider who prescribed them if you have concerns.
- If your scan is in the **morning**:
 - The evening before your scan, have a light dinner, such as eggs or a sandwich.
 - Do **not** eat breakfast on the morning of your scan.
- If your scan is in the **afternoon**:
 - On the morning of your scan, have a light breakfast, such as an egg and toast, or cereal.
 - Do **not** eat lunch.

On the Day of Your Scan

- **Remove anything that might contain metal.** This includes:
 - Makeup and nail polish
 - Hairpins
 - Jewelry
 - Glasses, hearing aids, and any removable dental work
- Take your regular medicines.
- **Starting 6 hours before your scan time:** Do **not** eat any solid food.
- It is OK to drink liquids that do not contain caffeine, milk, or chocolate up to 1 hour before your scan.
- **Starting 1 hour before your scan time:** Do **not** eat or drink anything.
- You must change into a hospital gown before your scan. We will give you a gown when you arrive in the MRI department.
- If you have an insulin pump or a patch that delivers any type of drug, we will ask you to remove it.
- *Women:* Before the scan, tell the technologist if there is any chance you could be pregnant.

What happens during the scan?

- You will lie on a movable table. The technologist will help get you into position.
- We may give you medicine to calm your bowels for a short time. This helps us get the clearest pictures.
- We will place a device called a *surface coil* over your lower belly. The coil is a special antenna that receives radio energy during the MRI. The coil weighs about 10 pounds. It will extend from your mid-thigh to the bottom of your ribs.
- The technologist will slide the table inside the MRI unit.
- The technologist will then leave the room to take the pictures.
- You can talk with the technologist at any time through an intercom.

- We will ask you to hold very still as each picture is taken. We may also ask to hold your breath for some of the pictures.
- After the scan, we will ask you to wait while we check the images for quality. If needed, we will take more pictures.
- The full scan usually takes 30 to 60 minutes.

What will I feel during the scan?

- MRI does not cause pain.
- Some patients may feel uneasy (*claustrophobic*) when they are inside the MRI unit. Please tell the doctor who referred you for the MRI if you feel uneasy in small spaces. You may receive medicine to help you relax.
- You may feel warmth in the area where the pictures are taken. This is normal. If it bothers you, please tell the technologist.
- You will hear loud tapping or knocking noises during the scan. We will give you earplugs and headphones with music to help block some of these sounds.

After the Scan

- Drink plenty of fluids the rest of the day to help flush the contrast out of your body. Try to drink 6 to 8 glasses of fluid.
- **If you received a medicine to calm your bowels before your scan:** Do **not** drive for 4 hours after your scan. To get home, you can have someone drive you; you can take a bus, taxi, or shuttle; or you can walk.

Questions?

Your questions are important. Call your doctor or healthcare provider if you have questions or concerns.

- ☐ UWMC - Montlake Imaging Services: 206.598.6200
- ☐ Harborview Imaging Services: 206.744.3105
- ☐ UWMC - Northwest Imaging Services: 206.668.2061

Who interprets the results and how do I get them?

A radiologist skilled in MRI will review and interpret your MRI images. The radiologist will not talk with you about the results, but will send a report to your provider who referred you for the scan. Your own provider will talk with you the results of your scan.

You and your provider will then decide the next step, such as treatment for a problem, as needed.

You may also read your results on your MyChart page. If you need copies of your images on disc, call 206.598.6206.
